SRS — ms_07 Supplier

1. Fungsi

Mengelola **master supplier**, katalog produk & harga pemasok, dan siklus **purchase order (PO)** dari permintaan warehouse hingga barang dikirim/diterima.

2. Kebutuhan

- CRUD supplier; katalog `supplier_products` (barang, harga, lead time).
- PO dibuat otomatis dari event `po.requested` (idempoten).
- Admin supplier mengonfirmasi, mengirim, dan menandai PO terkirim; tiap perubahan menerbitkan event.
- Admin supplier hanya melihat PO miliknya (`X-Supplier-Id`).
- Pembatalan PO hanya saat status `CREATED`.

3. Endpoint

Method	Path	Deskripsi	Peran
CRUD	`/suppliers`	Master supplier	OWNER
CRUD	`/supplier-products`	Katalog & harga	OWNER, SUPPLIER_ADMIN
GET	`/supplier-products?commodity_id=`	Penawaran per barang	WAREHOUSE_MANAGER
GET	`/purchase-orders`, `/{id}`	Daftar/detail PO	SUPPLIER_ADMIN, WAREHOUSE_MANAGER, OWNER
POST	`/purchase-orders/{id}/confirm`	Konfirmasi	SUPPLIER_ADMIN
PATCH	`/purchase-orders/{id}/ship`	Tandai dikirim	SUPPLIER_ADMIN
PATCH	`/purchase-orders/{id}/deliver`	Tandai tiba	SUPPLIER_ADMIN
POST	`/purchase-orders/{id}/cancel`	Batalkan	SUPPLIER_ADMIN, WAREHOUSE_MANAGER

4. Model Data

`suppliers`, `supplier_products`, `purchase_orders`, `purchase_order_items` — lihat er.puml.

5. Event

- Consume: `po.requested`.
- Publish: `po.confirmed`, `po.shipped`, `po.delivered`, `po.cancelled`.

6. Diagram

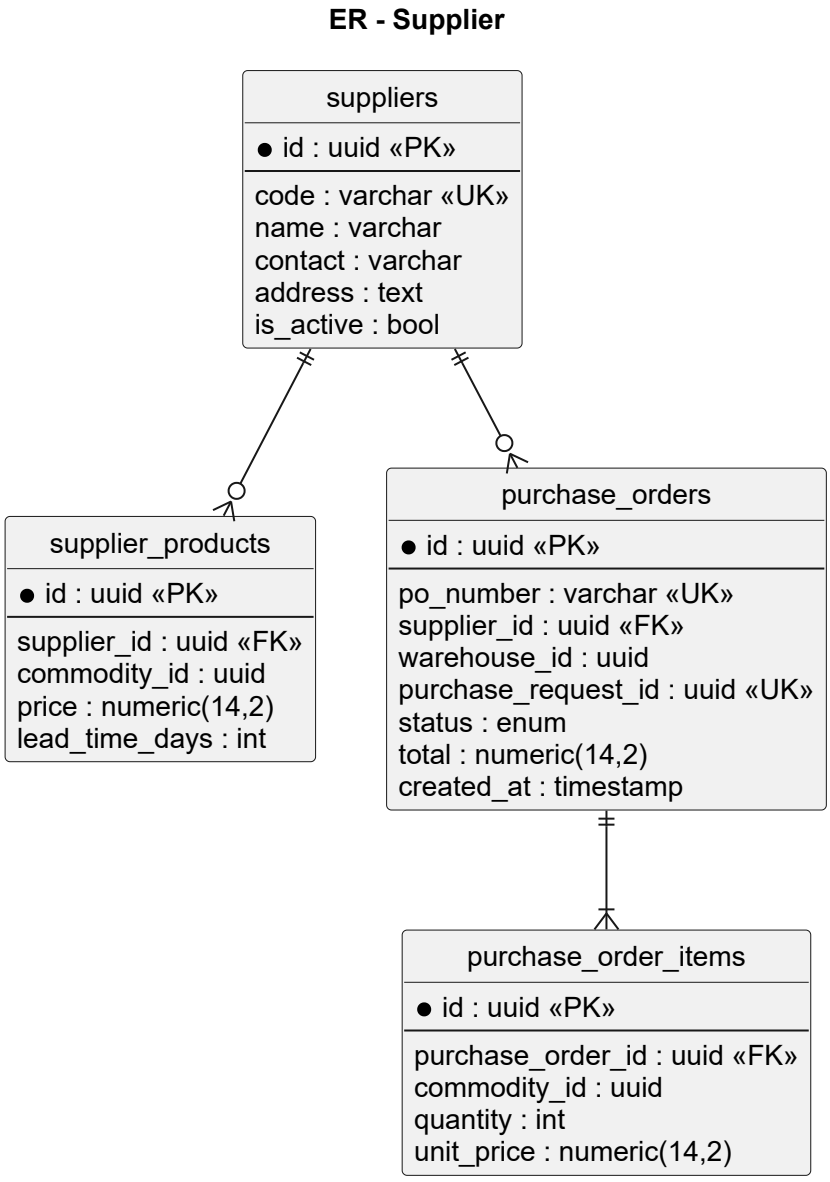

usecase.puml · er.puml · sequence_purchase_order.puml · state_purchase_order.puml

7. Cara Pembuatan

1. Database `db_supplier`; migrasi empat tabel + `processed_events`, `outbox_events`; unik `(supplier_id, commodity_id)`.
2. CRUD supplier & katalog.
3. Consumer `po.requested` → buat PO, harga diambil dari `supplier_products` (snapshot `unit_price`).
4. Mesin status PO + publisher event (outbox).
5. Pembatasan akses per `supplier_id`.
6. Uji: transisi ilegal, event ganda, otorisasi lintas supplier.
